

WHY APEX ORGANIC FERTILIZERS

- › A naturally based range, with up to 100% organic content
- › Added Humic Acid with unparalleled richness
- › Contains Polyhalite – an organic source of K, Ca, Mg
- › Has several sources of organic N & K
- › Enhanced microbial activity
- › Low salt analyses
- › Improves Cation Exchange Capacity

High organic fertilizers provide essential trace elements, micronutrients and primary biostimulant sources.

Rich Humates

The most powerful stimulant of beneficial fungi known. They can deactivate enzymes produced by pathogens that could compromise the plants immune system.

Polyhalite

Provides slowly released Potassium compared to other sources giving greater longevity. Magnesium aids chlorophyll production and improved photosynthesis and the Calcium strengthens plant cell walls, less susceptible to turf diseases.

Lignite

Used to improve Cation Exchange Capacity (CEC), Lignite reduces leaching and improves fertilizer efficiency. In conjunction with Potassium, it also provides an excellent source of Humic Acid that encourages root development and stimulates soil microbial activity.
